Copernicus EMS

Copernicus Emergency Management Service (CEMS) provides information for emergency response in relation to different types of disasters, including meteorological hazards, geophysical hazards, deliberate and accidental man-made disasters and other humanitarian disasters as well as prevention, preparedness, response and recovery activities

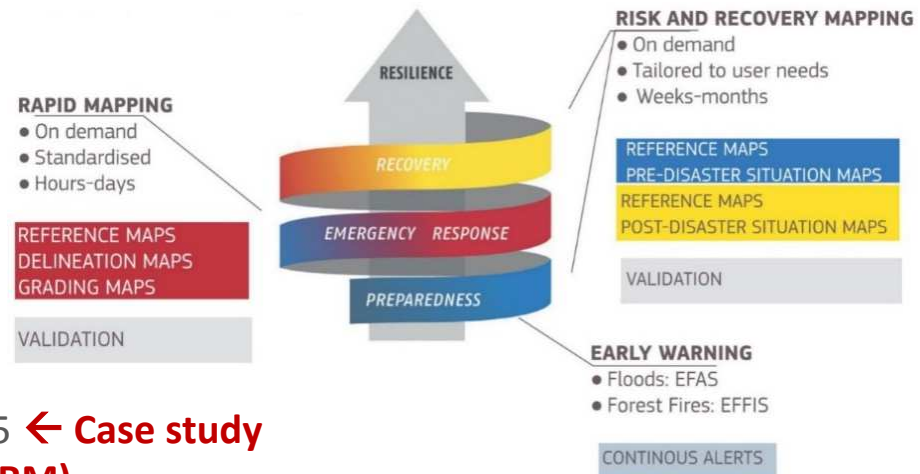

Two components:

- **EMS Mapping**
- **EMS Early Warning**

The EMS Mapping Component provides two service modules:

1. **Rapid Mapping (RM): 24/7/365 ← Case study**
2. **Risk and Recovery Mapping (RRM)**

In situ

Copernicus EMS - Rapid Mapping

CEMS – Rapid Mapping provides On-demand and fast (within hours or days) geospatial information in support of emergency management activities immediately following an emergency event such as: natural & man-made disasters globally

283

rapid mapping activations

3.000+

maps

2.500.000+

kmq delivered

50+

Countries worldwide

9h

from activation
Pre-event maps

3h

from satellite data availability
1st Post-event maps

Copernicus EMS RM – Workflow

OFF-LINE WORK

In situ Data collection

- ✓ Check of available data
- ✓ Setting of **EXTRACT, TRANSFORM, LOAD (ETL)** rules (Geometry, Thematic, Attributes) to harmonize the data according to the RM Data Model used during the production

↑ **EFFORT & TIME CONSUMING**

Copernicus EMS RM – Workflow

DURING AN EMERGENCY ACTIVATION

Activation Set-up

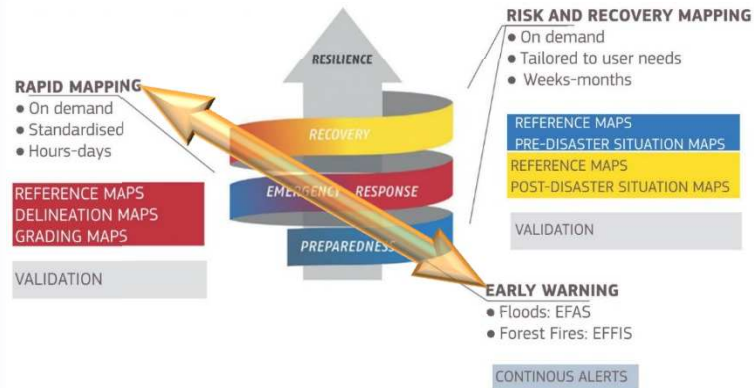

- ✓ Identification of Areas of Interest and Acquisition of satellite imagery for **PRE** and **POST-EVENT analysis**
- ✓ **Download** of in situ data in the current Data Model → **ETL**
- ✓ **Check** of **COMPLETENESS** and **CONSISTENCY** of downloaded reference data
- ✓ If necessary, the reference data are completed manually by the Production Specialists
- ✓ When the post-event is available, the affected areas are identified and the severity of damages are classified

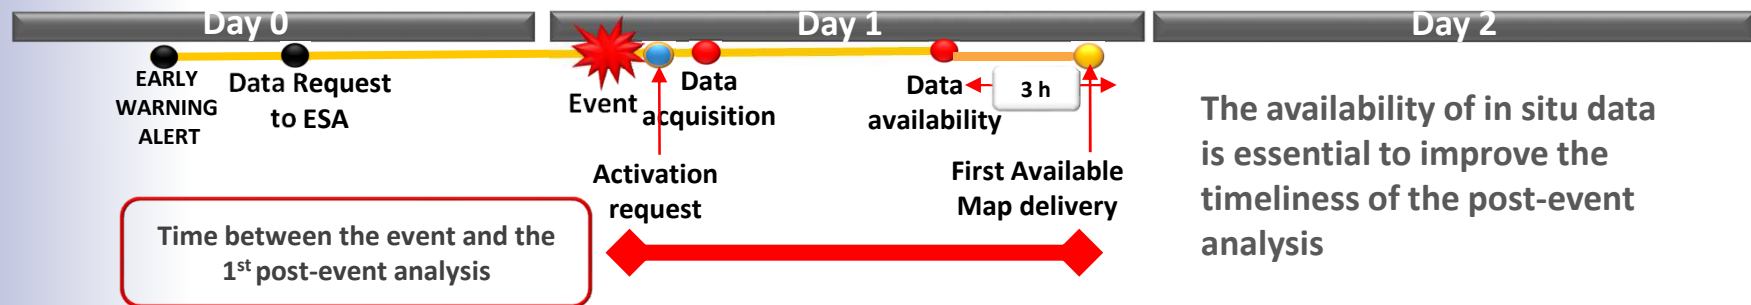

In situ

Copernicus EMS RM – Workflow 2.0

Floods and **storms** are types of disasters where **EARLY WARNING** and **TIMELY ALERT** are critical for the full success of the EMS Rapid Mapping activations

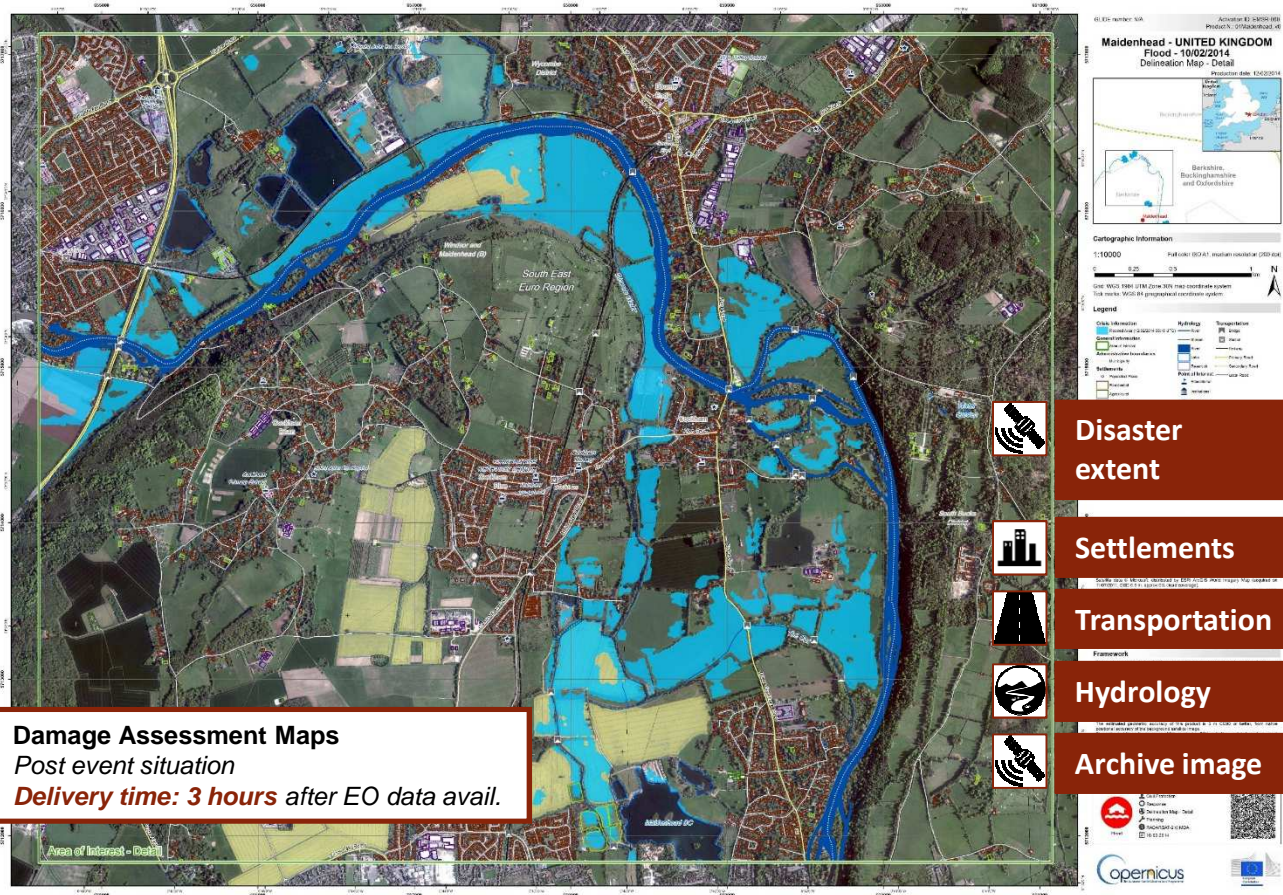

Improvement in the **TIMELINESS** of analysis with the connection between **EARLY WARNING** and **RAPID MAPPING SERVICES**

In situ

Copernicus EMS RM – Workflow

In situ

Copernicus EMS RM – In situ data requirements

The main data source used for the map production are:

- ✓ Settlements
- ✓ Industry and Utilities
- ✓ Hydrography
- ✓ Transport infrastructure
- ✓ Elevation
- ✓ Land cover
- ✓ Population/Census
- ✓ Toponyms

In situ

Copernicus EMS RM – Why do we need the in situ data?

The in situ data are paramount for the Service to:

1. **Reduce** the **delivery time**
2. **Increase** the **thematic and geometric accuracy of the products**
3. **Facilitate** the **integration of the data and information produced by the Service within the Users' environment**

In situ

Copernicus EMS RM - NMCA DATASETS

High quality datasets produced by NMCAs

ISSUES → availability vs usability

- **Special authorisation and/or human interaction** required to access them
- **Data harmonization** into Rapid Mapping service component databases

Both takes up **too much time** with respect to the RM requirements, making these valuable datasets actually **unusable**

In situ

Copernicus EMS RM - NMCA DATASETS

...Yet the main CHALLENGE is

- Accessing and exploiting **NMCA datasets within emergency management timeframe:**
 - ✓ Granting streamlined and timely access to reference data is of essential importance for the effectiveness of these services, exploiting standard WEB Services and allowing interactive spatial search and query tools to easily identify the available data groups.
- The use of a **common harmonized NMCA data model at EU level (ELS-like solutions):**
 - ✓ To avoid the Copernicus service providers to build a time consuming task on ad-hoc ETL procedures on a country-by-country basis.

Copernicus EMS RM – Use of NMCA datasets - Case Study

The intervention of *the Italian Cadastre* in the Copernicus project for the earthquake emergency in Central Italy

Settlement → Inspire theme: Buildings (**BU - Annex 3**)

+ Level of detail

- ✓ Very good geometric accuracy and completeness

+ The Cadastral layer easily used by the end user

- ✓ Civil protection
- ✓ Firefighters

- Availability Time

- ✓ Some maps in the same activation were delivered before the NMCA data availability

- Thematic and attributes information

- ✓ Data Harmonization issue with the RM data model
- ✓ National language, field, domain and values interpretation issues

Implemented
by

Copernicus EMS RM - Challenges and opportunities

CORDA Copernicus Reference Data Access

The **EEA** is working to make **NMCAs data** available via CORDA.

A **single entry point node** to the relevant national and regional geospatial **in situ data**:

- ✓ Single login solution
- ✓ Spatial search of datasets
- ✓ Complete catalogue of datasets by data provider
- ✓ Continuously updated portal and communications

- ✓ Not harmonized data model
- ✓ Some area not covered by proper services (WFS, download)
- ✓ Data download timeliness not compliant with the CEMS-RM time constraint

Implemented
by

In situ

Copernicus EMS RM - Challenges and opportunities

Does the **ELS solution** fit the **CEMS Rapid Mapping requirements** in terms of **access** and **common data model** to the NMCA in-situ datasets?

Test Phase evaluating the following functionalities:

ELS download services access timeliness and technical constraints

- Standard Web Services (24/7/365 availability).
- Interactive spatial search and query tools.

Data model

- Information and metadata about the adopted data model.
- The completeness of the thematic information within a common and harmonized NMCA data model.
