

The integration of geospatial and statistical data for European statistics

Christine Wirtz

Director (acting) - Sectoral and Regional Statistics

European Commission – DG Eurostat

The European Statistical System (ESS)

Together the Members of the ESS produce:

Official European statistics for informed decisions by EU policymakers, businesses and citizens

Value added of Eurostat
in the development of
European Statistics

Harmonised data for EU indicators
Common methodologies
Quality and comparability across MS

Why do we need geospatial data?

**To provide information with the appropriate spatial level
from local to global**

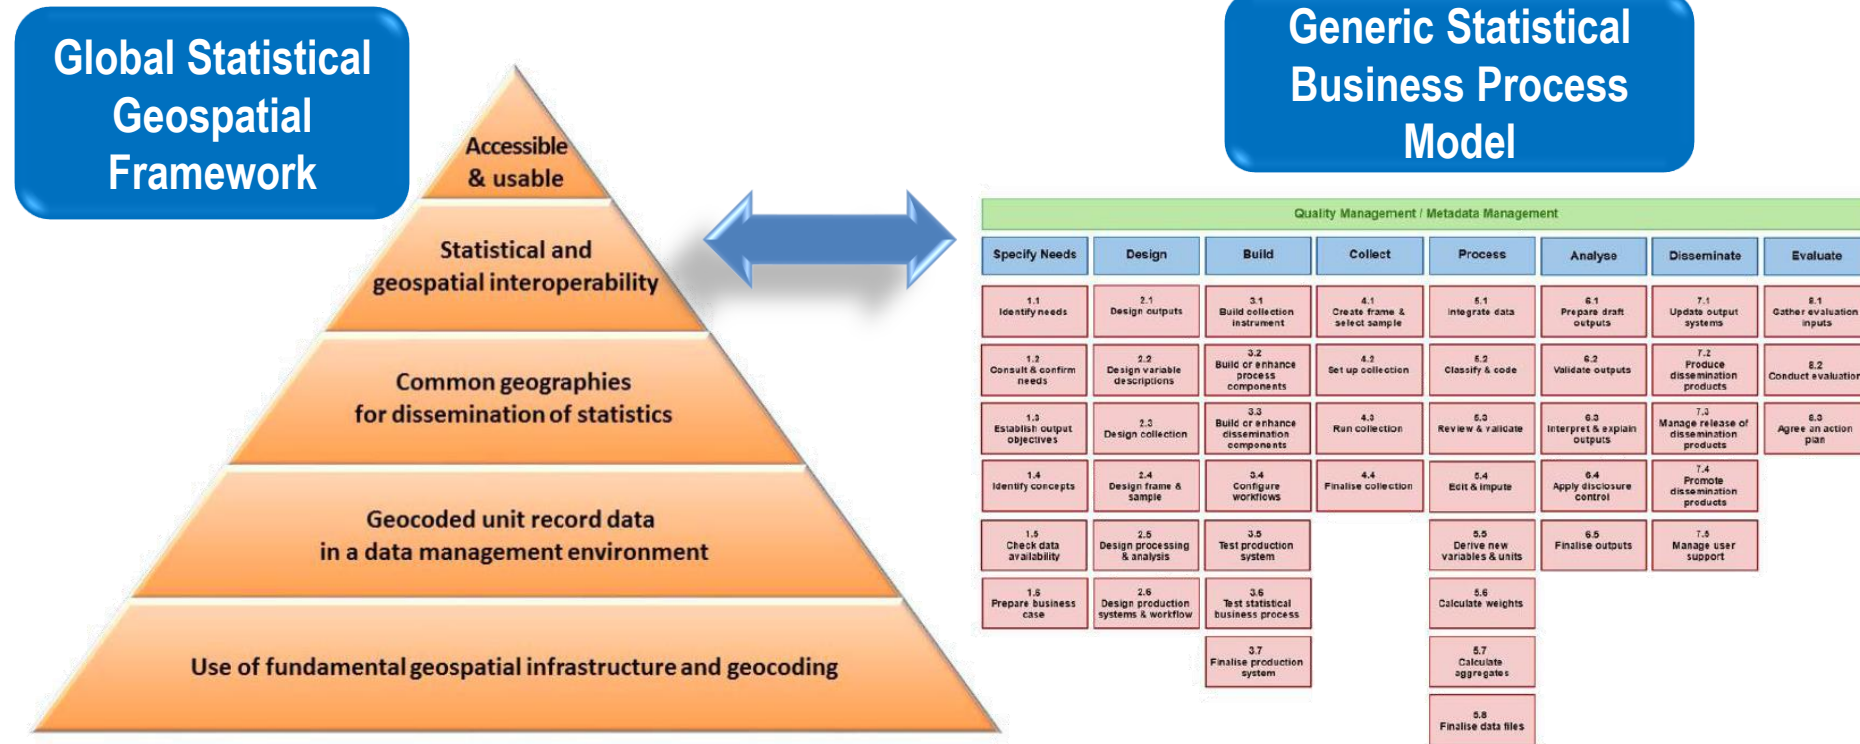

To underpin socio-economic and environmental analysis

**To allow for policy interventions at the level where they are
most effective**

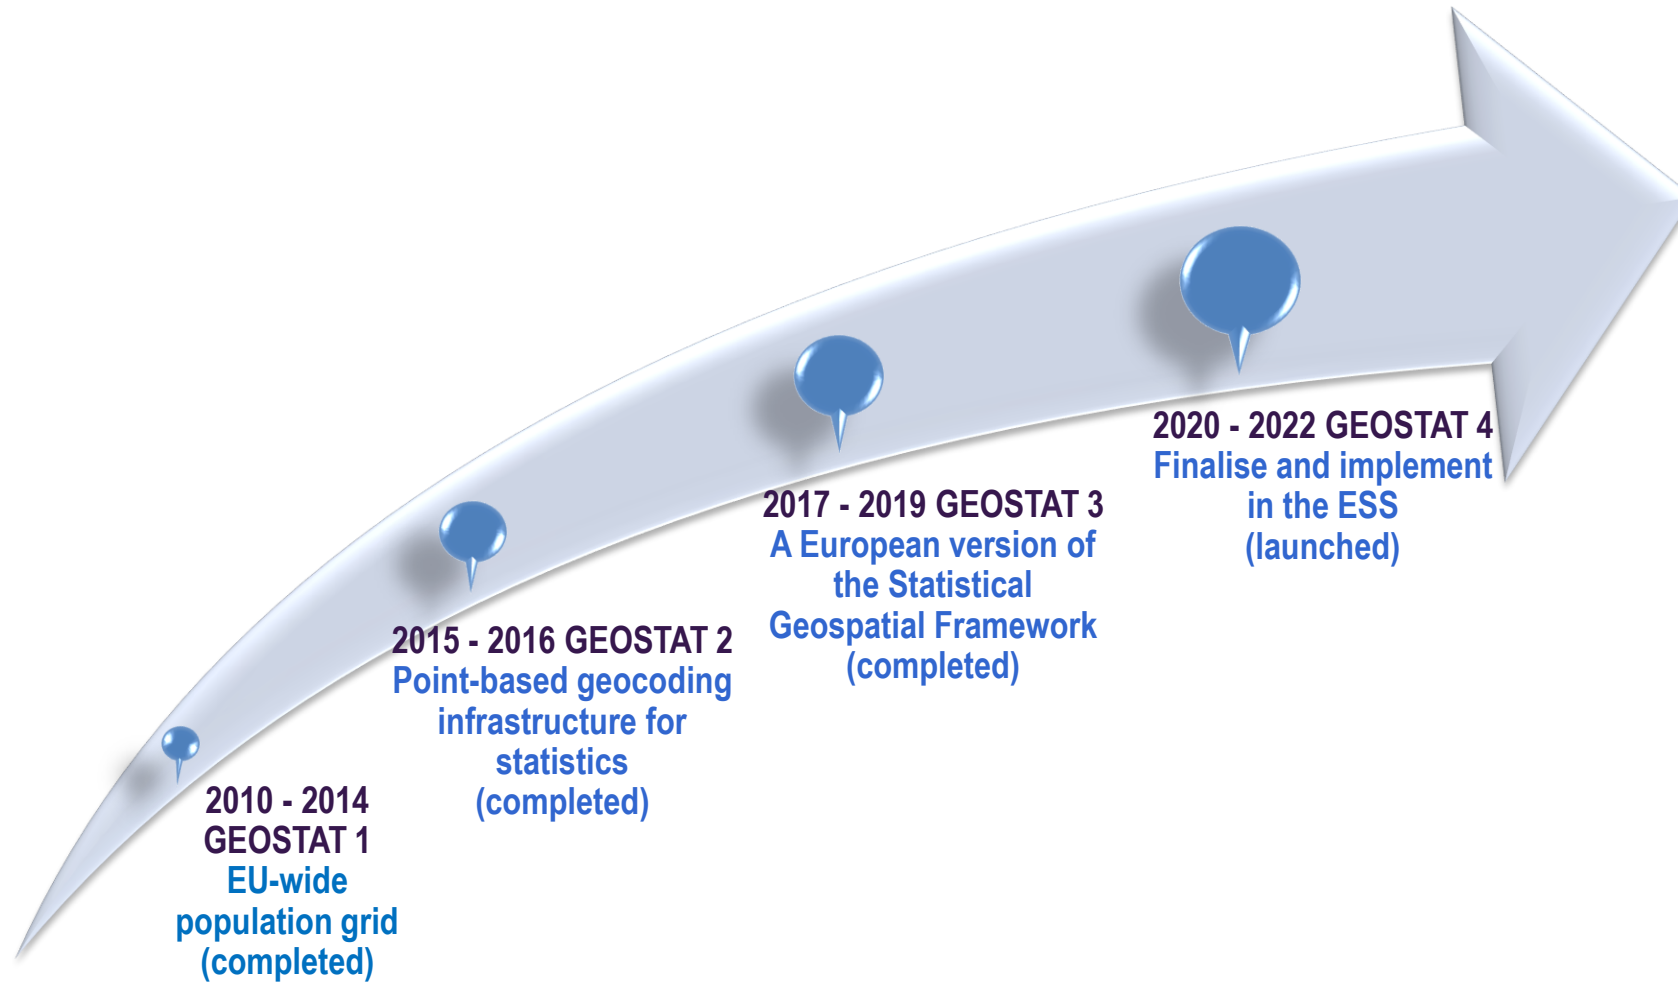

Statistical and geospatial data integration

Enhancing the generic business process model to better fit geospatial data production

EU GEOSTAT projects

Supporting the Integration of Statistics and Geospatial data

Figure 6: Number of single-family houses/ km²

Service areas within 30 minutes driving time of an emergency medical care centre

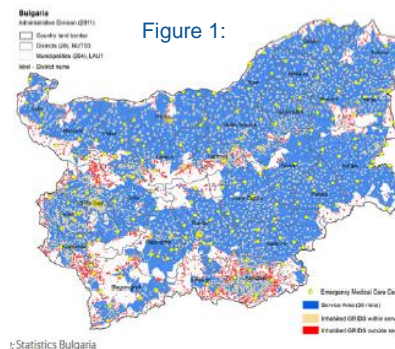

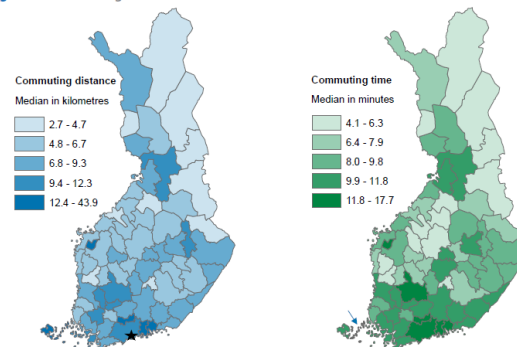

Figure 2: Commuting distance and median time

2012 - 2019
Over 40 national projects on merging statistics and geospatial information supported by Eurostat

Most frequent distance travelled by economically active commuters, 2013

Migratory flows to Italy, 2012-2015

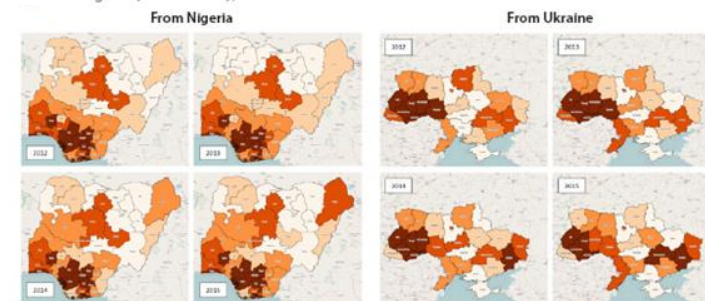

Figure 3

Eurostat's Geographical Information Systems to the Commission (GISCO)

Answers the needs of Eurostat and the European Commission for geographical information at the level of the European Union (EU), its Member States and regions.

Provides reference geographical information and related services for use within Eurostat and the Commission and to the European citizens at large.

Maintains the GISCO database with geographical data for all Europe such as administrative boundaries and thematic geospatial information (e.g. population grid).

Enabling spatial analysis: Airport Catchment areas

Eurostat supported the European Court of Auditors and calculated the number of potential passengers by defining the catchment areas for 20 audited airports in Europe plus their regional competitors.

The size of the catchment area, their resident population and the potential number of tourists were determined based on a journey time of 120min along the road network, the GEOSTAT 1km² population grid and NUTS3 based tourism statistics.

ECA found that more than 2/3 of the airports have largely overlapping catchment areas and often a large number of residents could reach several competing airports in less than two hours

Use of pan-European geographical datasets for EU policy

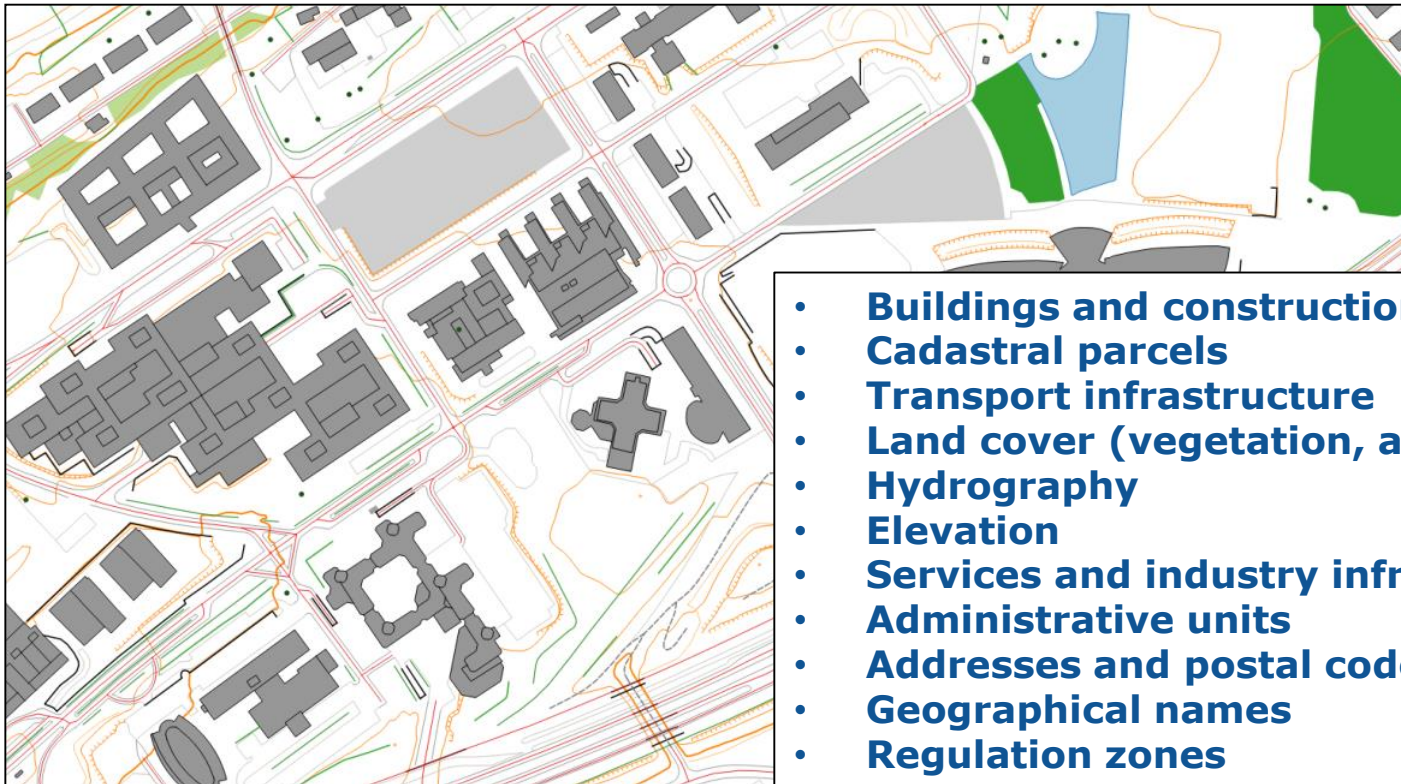

https://ec.europa.eu/regional_policy/en/newsroom/news/2019/01/01-03-2019-access-to-universities-in-the-eu-a-regional-and-territorial-analysis

National topographic databases

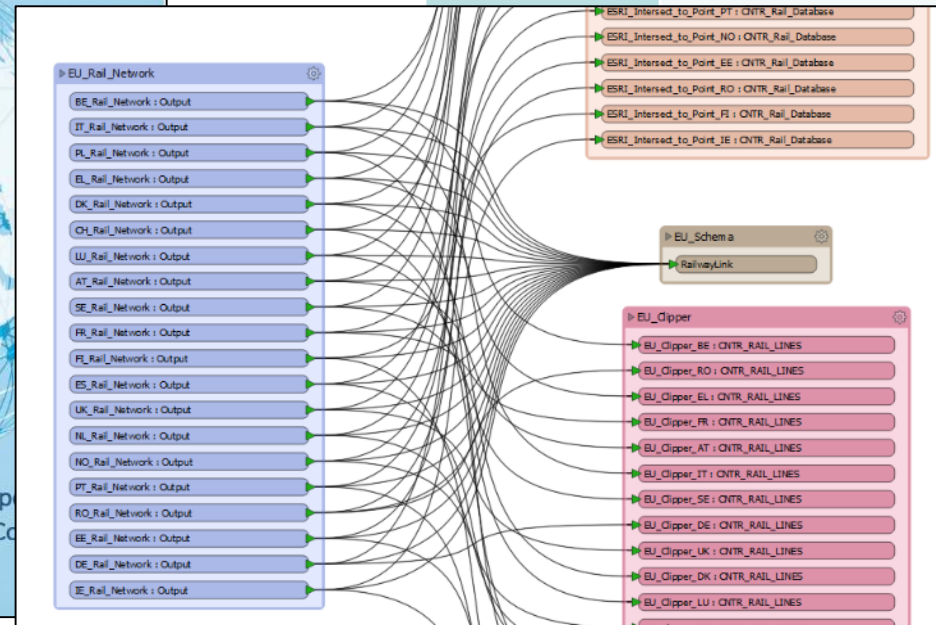

- **Buildings and constructions**
- **Cadastral parcels**
- **Transport infrastructure**
- **Land cover (vegetation, agriculture, etc.)**
- **Hydrography**
- **Elevation**
- **Services and industry infrastructure**
- **Administrative units**
- **Addresses and postal codes**
- **Geographical names**
- **Regulation zones**
- ...

European ~~National~~ topographic database ?

Developing Eurostat's technical capacity to combine national geospatial data

Type	Attribute	Values / enumeration	Priority

Edge-matching

Automated procedure developed
and successfully tested

Next:

- Fill missing gaps
- Routable and multi-scale
- Integrate other data sources (RINF, UIC, OpenStreetMap, ERM, transport statistics, ERA-ERTMS data, accessibility features, etc.)

Typologies for Statistics

European
Commission

Degree of urbanisation

A classification of local administrative units

Grid cells

Raster cells of 1 km² are classified using criteria of population density and contiguity. Where available, the population distribution is derived from registers. Elsewhere, it is downscaled from local (LAU) population figures.

Grid cells outside urban clusters

Rural
grid cells

Contiguous cells (including diagonals)
with a density of at least
300 inh./km² and a minimum of 5000 inhabitants

Urban clusters
> 5 000

Contiguous cells (without diagonals and with gap filling)
with a density of at least 1500 inh./km²
and a minimum of 50000 inhabitants

Urban centres
> 50 000

LAU units

The degree of urbanisation is a classification of local administrative units (LAU) based on the share of local population living in urban clusters and in urban centres.

At least 50% of population living
in rural grid cells

Rural
areas

< 50% of population in rural grid cells and
< 50% of population in urban centres

Towns
and
suburbs

At least 50% of population living in urban centres

Cities

Thinly populated areas

Intermediate density areas

Densely populated areas

Member States' expectations from Eurostat (GISCO WG in 2019)

Foster cooperation between the National Mapping Agencies and NSIs. Create legislation on data access and financial support (grants, projects, training)

Improve the availability of pan-European geospatial datasets

Promote harmonisation, standardisation and common methodologies

Provide a centralised infrastructure for geospatial data

Provide guidance on the geocoding of new data sources

As-is: How we work today

National Mapping Agencies participate to Eurostat's GISCO Working Group, created to bring together NSI and NMA

NMAs are the main geospatial data provider (Eurostat contracts with Eurogeographics, bilateral agreements, etc.)

Common projects in the framework of GEOSTAT, INSPIRE, UN-GGIM, UN-GGIM: Europe, 2021 census, etc.

Other?

To-be: Proposal for future collaboration

Enhance cooperation in creating new pan-European geospatial data – Eurostat needs authoritative geospatial data from the NMA

Develop more joint actions (at national level-NMA and European level-Eurostat)

Provide more support to NMA to work closer with NSIs

Organise regional meetings with NMA and NSIs to help enhance collaboration

Other?

Eurostat's Geospatial Data Strategy

Next Steps

Promote the use of the Global Statistical Geospatial Framework in the ESS and enable more georeferenced statistics

Develop pan-European geospatial datasets for key policy domains

Further promote the integration of statistics and geospatial information

Support and coordinate the collaboration of NSI and mapping agencies

Contribute to the setting of international standards on geographical information

Statistical governance structure
