

# How NLS Finland established the cadastre as a platform to provide information from other authorities to users

Mr. Arvo Kokkonen  
Director General  
October 2019

# NLS Finland as an authority

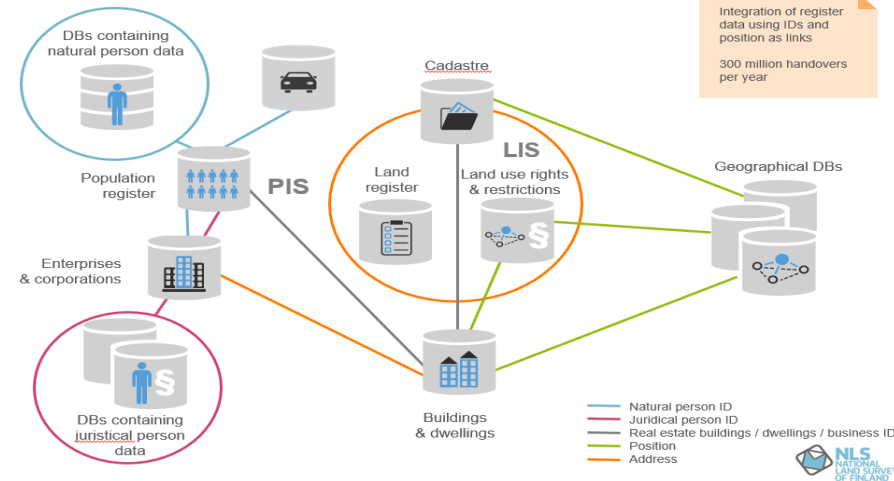

NLS maintains basic register systems in Finland

- NLS Finland maintains the following:

- Cadastre
- Title and mortgage register
- Residential and Commercial Property Information System
- Topographic database

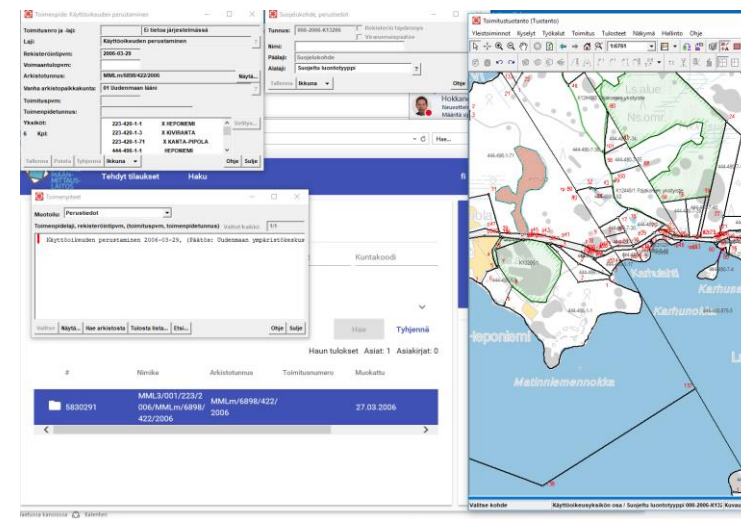

- The systems work together via interfaces.
- Interfaces are used to import information from and export information to systems maintained by other authorities.

## Key Register System

# The evolution of the Cadastre into a platform

- Nationwide coverage
  - Land Information System introduced in 2004
    - Cadastre and cadastral index map with nationwide coverage
    - NLS Finland maintains the system
    - NLS Finland and some municipalities produce data stored in the system
- Combining the right data
  - The register and its units (rights-of-use units) contain both location information and attribute data
  - Property information and topographic data are in the same system

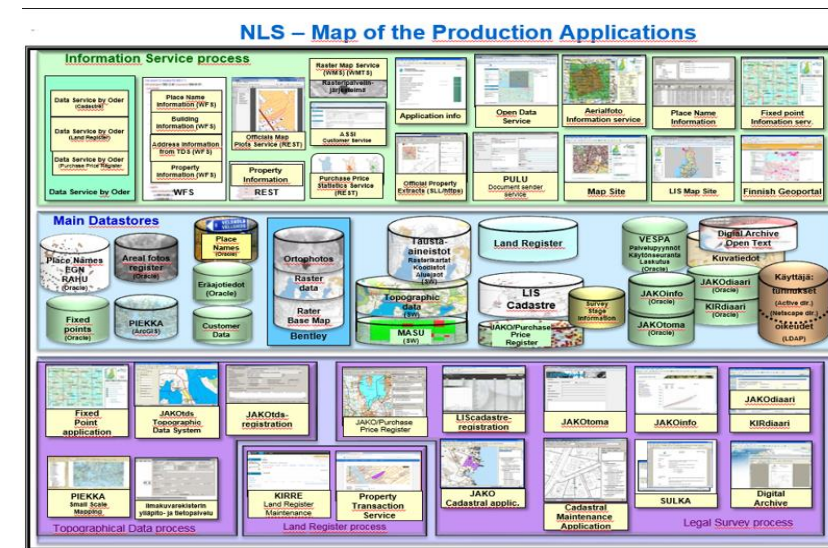

# The evolution of the Cadastre into a platform

- Supporting interoperability
  - Creating a uniform legislative base
    - Same legislation for rural and urban areas in 1995
      - Enabled the creation of standardised procedures
    - 3D properties and 3D property legislation from 2018
      - Creates a basis for a wide-ranging register base and uniform legislation

- Creating ecosystems
  - Functioning information search and interface solutions
  - Adding value for every participant in the system
