ESRI Quality Control:

An experience report

October, 2nd 2019

Federal Office of Topography swisstopo:
Stefan Flury, Andreas Wyss

What did I want

You asked me for a field report about the ESRI ProSuite

- I searched for data where I can implement a QA specification.
 - That was the easy part
- Then I was looking for descriptions of the data model
 - Also easy 😊. I found a UML diagram and text
- Next, find the data. Another easy step.
 - I asked my colleague. He gave me a file geodatabase.
- Finally, find the documentation for the ESRI ProSuite QA framework. The software was already installed (32bit and 64bit). The documentation you will find at the 32bit version.
 - [EsriCH.QA.Tests.QuickReference_en.pdf](#)
 - [ProSuite_QA_Tests_en.html](#)

What do we have

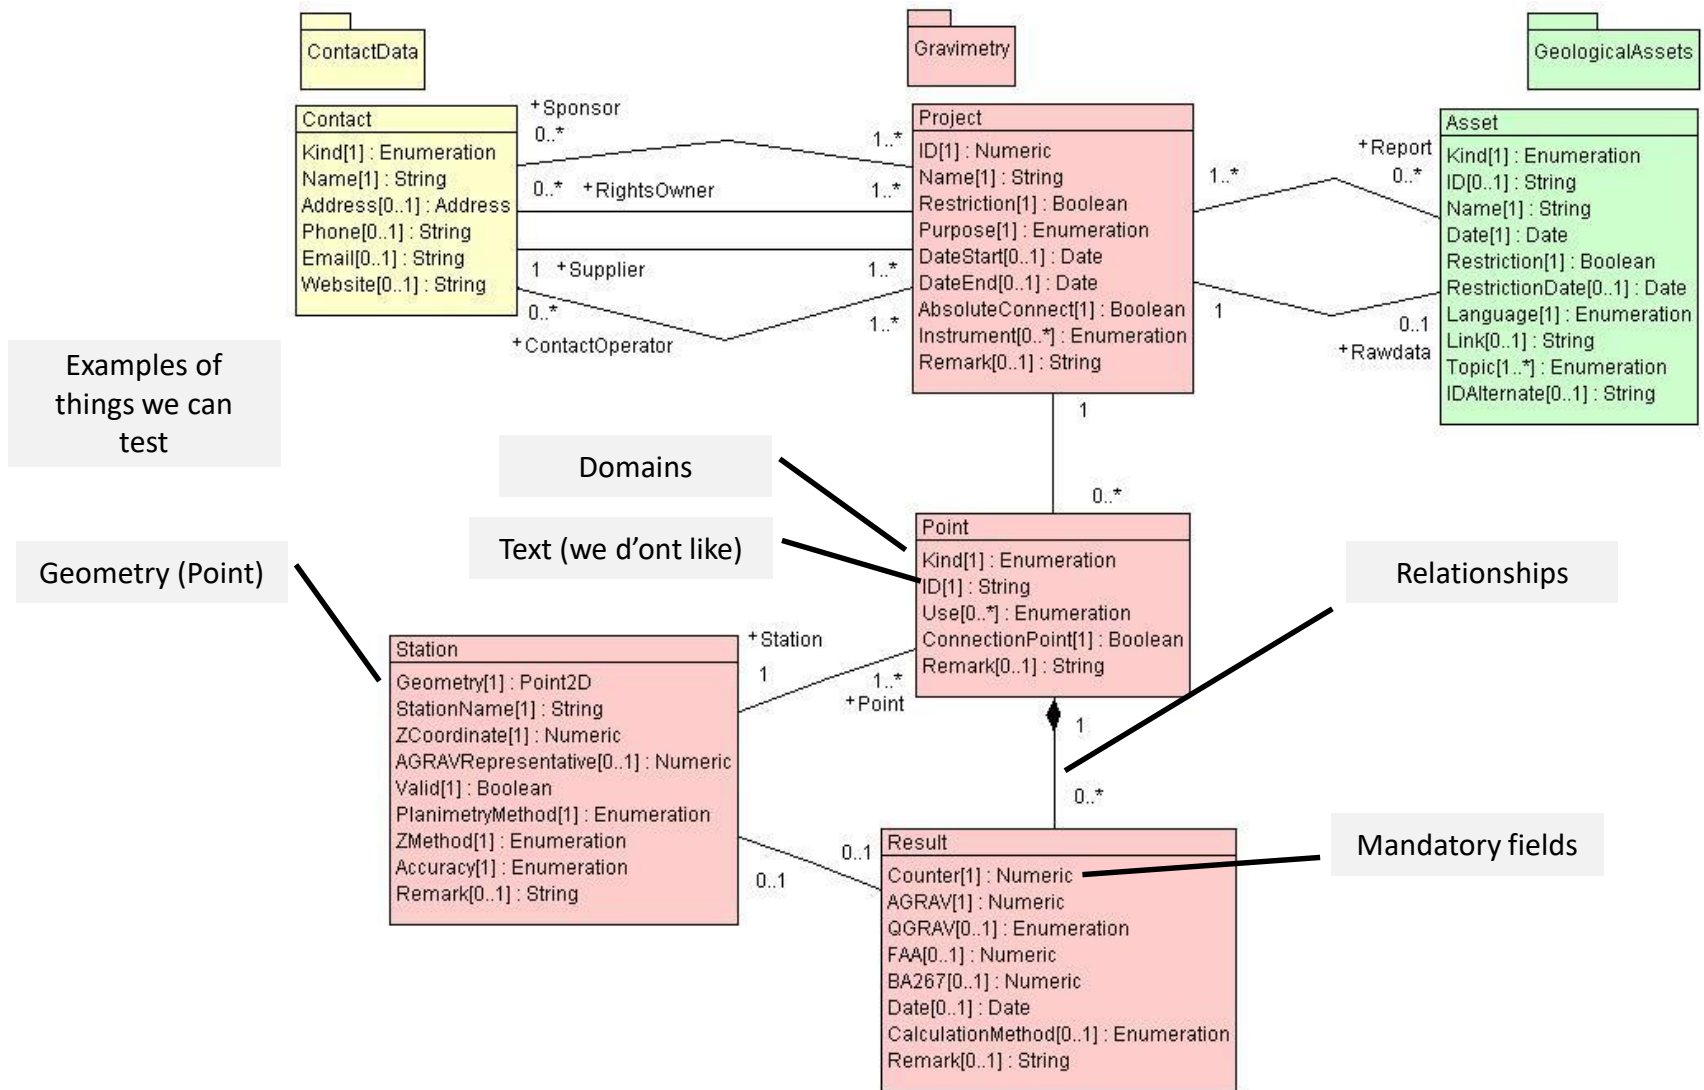

- It's a model to store gravitational measurements
- Data model description as UML and text
- A file geodatabase with data, not yet finished, just a first version. The result will help to ameliorate the import process
- A virtual machine with installed 32bit and 64bit software
- The documentation

Important remark:

The model is work in progress. It was defined at the “green table”. We got the data as excel file and try now, to bring them into the model. I'm sure we'll find some small mistakes.

UML

The model documentation

Section of the object catalog (just in german)

1.2 Klasse Point

In der Klasse Point werden alle Attribute gruppiert, die für die Beschreibung eines gravimetrischen Messpunktes relevant sind:

No	Attribut-name	Kardinalität	Datentyp	Wertebereich/ Einheit	Beschreibung
1	Geometry	[1]	Coordinate	E und N LV95 [in m]	Geometrie der Obj Point (Messpunkt)
2	Kind	[1]	Enumeration	Tabelle 1.2.2	Art des Objektes Messpunkt
3	ID	[1]	Text	10 Zeichen	Identifikator des Messpunktes
4	ZCoordinate	[1]	Numeric	LNo2 [in m]	Höhe des Messpunktes
5	QGeometry	[0..1]	Enumeration	Tabelle 1.2.5	Methode der Koordinatenbestimmung
6	OZ	[1]	Enumeration	Tabelle 1.2.6	Methode der Höhenbestimmung
7	QPoint	[0..1]	Boolean	yes/no	Qualität der Punktdaten
8	Use	[0..*]	Enumeration	Tabelle 1.2.9	Verwendung der Messpunktdaten
9	Remarks	[0..1]	Text	200 Zeichen	Bemerkung zum Messpunkt

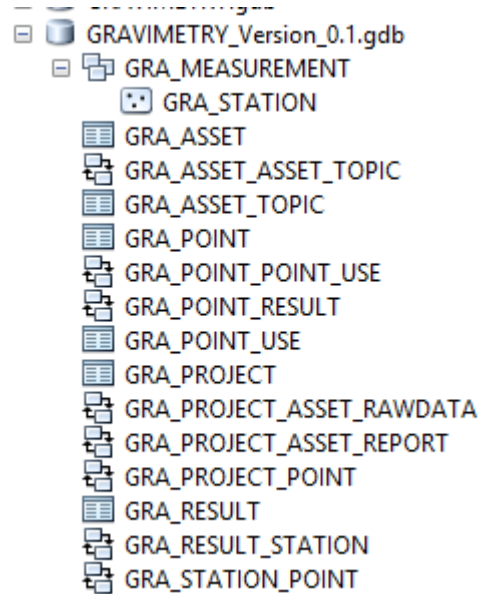

1.2.2 Kind

Die nachfolgende Auflistung gibt die zulässigen Werte der Objektart Point (Messpunkt) an. Die verschiedenen Ordnungen der Messpunkte sind in Kap. 1, 1.2.2 kurz beschrieben.

GeolCode	Attributwert DE	Beschreibung
	Absolutpunkt, 0. Ordnung	Absolutstationen und deren Exzentren
	Relativpunkt, 1. Ordnung	LSN-Punkte 1. Ordnung
	Relativpunkt, 2. Ordnung	LSN-Punkte 2. Ordnung
	Relativpunkt, 3. Ordnung	LSN-Punkte 3. Ordnung
	Nivellement	Punkt des Landesnivellements

File geodatabase

Field Name	Data Type
OBJECTID	Object ID
Shape	Geometry
UUID	Guid
NAME	Text
VALID	Long Integer
PLANIMETRY_METHOD	Long Integer
PLANIMETRY_ACCURACY	Long Integer
HEIGHT_METHOD	Long Integer
HEIGHT_ACCURACY	Long Integer
REMARKS	Text
GRA_RESULT_UUID	Guid

Click any field to see its properties.

Field Properties

Alias	Valid	
Allow NULL values	Yes	
Default Value		
Domain	GRA_BOOLEAN_CD	

Let us start to configure Theory

Important to know:

- In the section **TestDescriptors** you add all TestDescriptor(s) you need. A TestDescriptor describes the function in a program library.
- In the section **QualityConditions** you add all QualityCondition(s). A QualityCondition sets the parameter of a TestDescriptor.
- In the section **QualitySpecifications** you add all qualityCondition(s) which should be executed in this specification. A QualitySpecification has a name and a list of QualityCondition(s).

Let us start to configure it's a XML file (overview)

I got a template from a colleague. The fields of the same colour are keys and create the relations

```
<?xml version="1.0" encoding="utf-8"?>
<DataQuality xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xmlns:xsd="http://www.w3.org/2001/XMLSchema"
xmlns="urn:EsriDE.ProSuite.QA.QualitySpecifications-2.0"
xsi:noNamespaceSchemaLocation="./EsriDE.ProSuite.QA.QualitySpecifications-2.0.xsd">
  <QualitySpecifications>
    <QualitySpecification name="GRAVI Base" listOrder="0">
      <Elements>
        <Element qualityCondition="GRA_Station Name not null" />
      </Elements>
    </QualitySpecification>
  </QualitySpecifications>
  <QualityConditions>
    <QualityCondition name="GRA_Station Name not null" testDescriptor="Constraint(0)" allowErrors="False">
      <Parameters>
        <Dataset parameter="table" value="GRA_STATION" workspace="GRAVI" />
        <Scalar parameter="constraint" value="NAME IS NULL" />
      </Parameters>
    </QualityCondition>
  </QualityConditions>
  <TestDescriptors>
    <TestDescriptor name="Constraint(0)" allowErrors="false">
      <TestClass type="EsriDE.ProSuite.QA.Tests.QaConstraint" assembly="EsriDE.ProSuite.QA.Tests" constructorIndex="0" />
    </TestDescriptor>
  </TestDescriptors>
  <Workspaces>
    <Workspace id="GRAVI" modelName="GRAVI" />
  </Workspaces>
</DataQuality>
```

Let us start to configure it's a XML file (TestDescriptors)

Our first test is:

Is the attribute Name in the feature class GRA_Station for any object null or empty?

In the EsriCH.QA.Tests.QuickReference_en.pdf you will find:

Freely defined attribute conditions

Finds rows in tables and feature classes that do not fulfil the defined attribute conditions.

The conditions can be organized in a hierarchical structure. Parent conditions successively restrict the set of rows to be tested. Conditions defined at the lowest hierarchy level are then verified for the resulting set of rows.

Attribute conditions for joined tables can also be tested.

Alternatively, the attribute conditions can be defined in a separate database table.

Tests: **QaConstraint**, *QaDatasetConstraintFactory*, *QaRelConstraint*, *QaConstraintListFactory*

```
Objecttype=Path (Selection)
+Width IS NULL OR
  Width < 4 (Condition)

Objecttype=Motorway (Selection)
+Width > 10 (Condition)
+Surface <> 'Loose' (Condition)
```

ID	Objecttype	Width	Surface
X 1	Path	6m	Loose
2	Path	3m	Loose
3	Motorway	12m	Hard
X 4	Motorway	12m	Loose

Let us start to configure it's a XML file (TestDescriptors)

In the ProSuite_QA_Tests_en.htm you will find:

QaConstraint		
Categories:		Attributes
Implementation:		Test class EsriDE.ProSuite.QA.Tests.QaConstraint in EsriDE.ProSuite.QA.Tests.dll
Issue Code	Description	
Constraints.ErrorEvaluatingExpression	Error evaluating constraint expression	
Constraints.ConstraintNotFulfilled	The constraint is not fulfilled	
QaConstraint - constructor index: 0		
Signature:		ITable table, String constraint
Description:		Finds all rows in 'table' that do not fulfill 'constraint'
Parameter	Type	Description
table	ITable	table
constraint	String	checked constraint

```
<TestDescriptors>
  <TestDescriptor name="Constraint(0)" allowErrors="false">
    <TestClass type="EsriDE.ProSuite.QA.Tests.QaConstraint"
      assembly="EsriDE.ProSuite.QA.Tests" constructorIndex="0" />
  </TestDescriptor>
</TestDescriptors>
```

Tip: name equal test + constructorIndex -> Constraint(0)

Let us start to configure it's a XML file (QualityCondition)

In the ProSuite_QA_Tests_en.htm you will find:

QaConstraint		
Categories:		Attributes
Implementation:		Test class EsriDE.ProSuite.QA.Tests.QaConstraint in EsriDE.ProSuite.QA.Tests.dll
Issue Code	Description	
Constraints.ErrorEvaluatingExpression	Error evaluating constraint expression	
Constraints.ConstraintNotFulfilled	The constraint is not fulfilled	
QaConstraint - constructor index: 0		
Signature:		ITable table, String constraint
Description:		Finds all rows in 'table' that do not fulfill 'constraint'
Parameter	Type	Description
table	ITable	table
constraint	String	checked constraint

```
<QualityCondition name="GRA_Station Name not null" testDescriptor="Constraint(0)"
    allowErrors="False">
  <Parameters>
    <Dataset parameter="table" value="GRA_STATION" workspace="GRAVI" />
    <Scalar parameter="constraint" value="NAME IS NULL" />
  </Parameters>
</QualityCondition>
```

Tip: name: what does the test
testDescriptor links to TestDescriptors

Let us start to configure it's a XML file (QualityCondition)

```
<QualitySpecification name="GRAVI Base" listOrder="0">
  <Elements>
    <Element qualityCondition="GRA_Station Name not null" />
  </Elements>
</QualitySpecification>
```

Tip:

- name: what does this set of test(s)
- Elements: contains a list of qualityConditions.
The GRA_Station Name not null corresponds to the attribute name in the section QualityCondition

And now?

- Start GpTool

Quality Verification (XML-based)

Conclusion

- Yes, you can
- It's not easy, you have to know XML
- You need a example to start
- You need time
- But you know what you test

What can I offer to you?

- The GRAVIMETRY – Schema (ESRI file geodatabase XML)
- My first QA.XML with 35 Tests
- A small python script to launch the gptool
