

Report from ISO 19157-1 review

Ivana and Torsten has just start the work to review the Geospatial data quality standard 19157-1

One of the main reasons iterated through various comments supporting the call for revision, was the need to update the definition and the use of standard's terminology.

- **Terms such as accuracy, uncertainty, correctness seem to have confusing definition and use throughout the standard**
- **Terms such as 'trustworthiness' or 'trueness' were suggested for consideration**
- **A comment has been made that the main term from ISO 19157's title 'data quality' has never been defined in the standard and should be included**

- You are all welcome to suggest improvements to the standard
- We have send an abstract to the Quality Conference at Malta
